

Breast Pathway Group – Paclitaxel Albumin (Abraxane) in Early Breast Cancer

Indication:	Alternative for the neo-adjuvant treatment of breast cancer in patients who have documented taxane hypersensitivity (unlicensed use)
	Alternative treatment for the adjuvant treatment of breast cancer in patients who have documented taxane hypersensitivity (unlicensed use)
Regimen details:	Paclitaxel Albumin (Abraxane) 260mg/m ² IV Day 1
Administration:	The dose will be supplied as 5mg/ml solution in an empty 250ml infusion bag given over 30 minutes. Do not use an in-line filter.
Frequency:	Day 1, every 21 days, for 3 to 4 cycles
Pre-medication:	Not routinely required
Anti- emetics:	Low emetogenicity Follow Local Anti-emetic Policy
Supportive medication:	GCSF as per Local Policy Mouthcare as per Local Policy
Extravasation:	Vesicant Paclitaxel albumin (Abraxane) should be administered with appropriate precautions to prevent extravasation. If there is any possibility that extravasation has occurred, contact a senior member of the medical team and follow local protocol for dealing with cytotoxic extravasation

Version: 1.0 Supersedes: all other versions	Approved by LCA Breast Pathway Chemotherapy Lead: Mark Harries
Reason for Update: LCA Protocol Development	Approved by LCA Joint Delivery Subgroup Co-Chairs: Pauline McCalla & Rebecca Johl
Prepared by: Lisa Yuen	Approved by LCA Medicines & Chemotherapy Steering Group Chair: Jamie Ferguson
Second check by: Laura Cameron	Date prepared: November 2014 Review Date: November 2016
<small>Disclaimer: The Joint Delivery Chemotherapy Nurse/Oncology Pharmacist Group is a sub-group of the Medicines & Chemotherapy Steering Group (MCSG) working within the London Cancer Alliance Integrated Cancer System (LCA). The output of the LCA MCSG includes documentation that can be adopted by healthcare organisations at their discretion. It is the responsibility of each individual organisation to ensure that appropriate governance and safety clearance procedures within their own clinical service have been followed prior to implementation of any such pieces of work. LCA assume no responsibility for this process within individual organisations, and no responsibility for the clinical management of individual patients or patient groups. Any clinical queries regarding individual patients or documentation should be directed to the relevant clinical team within the most appropriate healthcare organisation.</small>

Regular investigations:	Prior to Cycle 1:	
	FBC	Day 1 (within 14 days)
	LFTs	Day 1 (within 14 days)
	U&Es	Day 1 (within 14 days)
	MUGA scan/ECHO	See Comments

Prior to Day 1 (all cycles):	
FBC	Day 1 (within 72 hours)
LFTs	Day 1 (within 72 hours)
U&Es	Day 1 (within 72 hours)

Toxicities: Myelosuppression, infection, neuropathy, anaemia, alopecia, fatigue, myalgia, arthralgia, nausea, vomiting, diarrhoea, stomatitis, cardiotoxicity, skin reactions, nail disorders, eye problems, anorexia, pneumonitis, dizziness, hypersensitivity reactions (uncommon - see comments)

DOSE MODIFICATIONS

Haematological Toxicity

Neutrophils (x 10 ⁹ /L)		Platelets (x 10 ⁹ /L)	Dose
≥ 1.0	&	≥ 100	100%
< 1.0	& / or	< 100	Delay for 1 week. Repeat FBC - if recovered to above these levels, resume treatment with 100% dose

In neoadjuvant/adjuvant treatment, dose reduction and delays can compromise outcome.

- GCSF should be considered if more than one delay and/or before dose reduction. If in doubt, seek Consultant advice.
- If during the preceding cycle, the patient has experienced neutrophils < 0.5 x 10⁹/L or has febrile neutropenia diagnosed, GCSF should be considered.
- If despite GCSF treatment, febrile neutropenia occurs or a dose delay is required - seek Consultant advice and consider dose reduction by 25%
- If platelets persistently < 100 x 10⁹/L on Day 1 despite dose delay - seek Consultant advice and consider dose reduction by 25%

Non-haematological Toxicities**Renal Impairment**

Studies in patients with impaired renal function have not been performed and insufficient data are currently available to recommend dose modifications in patients with renal impairment.

Hepatic Impairment

Bilirubin		AST / ALT	Dose
< 2 x ULN	& / or	< 2 x ULN	100% dose
2 - 5 x ULN		2.5 - 9 x ULN	Reduce to 220mg/m ²
> 5 x ULN		> 10 x ULN	Discontinue

Dose modifications for other toxicities as appropriate**Sensory neuropathy**

Grade	Sensory neuropathy	1 st occurrence	2 nd occurrence
1	Paresthesia (including tingling) but not interfering with function	Give 100% dose	Give 100% dose
2	Paresthesia interfering with function, but not interfering with activities of daily living	Give 100% dose	Give 100% dose
3	Paresthesia interfering with activities of daily living	Withhold until recover to grade 1-2, then reduce dose to 220mg/m ²	Withhold until recover to grade 1-2, then reduce dose to 180mg/m ²
4	Disabling	Withhold until recover to grade 2, then reduce dose to 220mg/m ²	Withhold until recover to grade 2, then reduce dose to 180mg/m ² or discontinue

Location of regimen delivery:

Outpatient setting.
Availability of resuscitation equipment must be ensured as a standard precaution.

Comments:

Hypersensitivity

Hypersensitivity reactions are rare, however very rare events of anaphylaxis have been reported. Availability of resuscitation equipment must be ensured as a standard precaution. If a

hypersensitivity reaction occurs, Abraxane should be discontinued immediately and symptomatic treatment should be initiated. The patient should **not** be rechallenged.

Cardiotoxicity

Rare reports of congestive heart failure and left ventricular dysfunction have been observed in patients with underlying cardiac history or previous exposure to cardiotoxic products such as anthracyclines. Patients should be monitored for the occurrence of cardiac events.

Visual acuity

Post-marketing experience has identified rare reports of reduced visual acuity due to cystoid macular oedema. Treatment should be discontinued.

Sodium content

When reconstituted, paclitaxel albumin (Abraxane) contains approximately 425 mg sodium per dose. To be taken into consideration by patients on a controlled sodium diet

Drug interactions:

The metabolism of paclitaxel is catalysed, in part, by cytochrome P450 isoenzymes CYP2C8 and CYP3A4. Caution should be exercised when administering paclitaxel concomitantly with medicines known to inhibit (e.g. ketoconazole and other imidazole antifungals, erythromycin, fluoxetine, gemfibrozil, cimetidine, ritonavir, saquinavir, indinavir, and nelfinavir) or induce (e.g. rifampicin, carbamazepine, phenytoin, efavirenz, nevirapine) either CYP2C8 or CYP3A4.
