

## Breast Pathway Group - Epirubicin (3 weekly) in Advanced Breast Cancer

Indication:	First line palliative therapy in advanced breast cancer patients who have not been previously treated with anthracycline and are not fit for combination chemotherapy with AC, EC or FEC		
Regimen details:	Epirubicin	*75 mg/m <sup>2</sup> (*)	IV Day 1
	* Consultant may consider Epirubicin 60 – 90 mg/m <sup>2</sup> , depending on patient status e.g. Epirubicin 60mg/m <sup>2</sup> if patient > 60 years		
Administration:	IV bolus injection via a fast-running Sodium Chloride 0.9% infusion		
Frequency:	Day 1, every 21 days, for 6 cycles		
Pre-medication:	Not routinely required		
Anti- emetics:	Moderate emetogenicity Follow Local Anti-emetic Policy		
Supportive medication:	Mouthcare as per local policy		
Extravasation:	Vesicant Epirubicin should be administered with appropriate precautions to prevent extravasation. If there is any possibility that extravasation has occurred, contact a senior member of the medical team and follow local protocol for dealing with cytotoxic extravasation		
Regular investigations:	Prior to Cycle 1:		
	FBC		Day 1 (within 14 days)
	LFTs		Day 1 (within 14 days)
	U&Es		Day 1 (within 14 days)
	MUGA scan/ECHO		See Comments

Version: 1.0 Supersedes: all other versions	Approved by LCA Breast Pathway Chemotherapy Lead: Mark Harries November 2014	
Reason for Update: LCA Protocol Development	Approved by LCA Joint Delivery Subgroup Co-Chairs: Pauline McCalla & Rebecca Johl	
Prepared by: Graeme Hood	Approved by LCA Medicines & Chemotherapy Steering Group Chair: Jamie Ferguson	
Second check by: Lisa Yuen	Date prepared: November 2014	Review Date: November 2016
<p>Disclaimer: The Joint Delivery Chemotherapy Nurse/Oncology Pharmacist Group is a sub-group of the Medicines &amp; Chemotherapy Steering Group (MCSG) working within the London Cancer Alliance Integrated Cancer System (LCA). The output of the LCA MCSG includes documentation that can be adopted by healthcare organisations at their discretion. It is the responsibility of each individual organisation to ensure that appropriate governance and safety clearance procedures within their own clinical service have been followed prior to implementation of any such pieces of work. LCA assume no responsibility for this process within individual organisations, and no responsibility for the clinical management of individual patients or patient groups. Any clinical queries regarding individual patients or documentation should be directed to the relevant clinical team within the most appropriate healthcare organisation.</p> <p>©LCA Copyright 2014</p>		

Prior to Day 1 (all cycles):	
FBC	Day 1 (within 72 hours)
LFTs	Day 1 (within 72 hours)
U&Es	Day 1 (within 72 hours)
CT scan	Every 3 cycles

Toxicities: Myelosuppression, cardiotoxicity, mucositis, stomatitis, nausea, vomiting, diarrhoea, alopecia, urine discoloration, potential risk of infertility / early menopause, fatigue, skin sensitivity to sun exposure

## DOSE MODIFICATIONS

### Haematological Toxicity

Neutrophils (x 10 <sup>9</sup> /L)		Platelets (x 10 <sup>9</sup> /L)	Dose
≥ 1.5	&	≥ 100	100% dose
< 1.5	or	< 100	Delay for 1 week. Repeat FBC, if recovered resume at 100% dose. Consider dose reduction for >1 delay.

- Dose reduction and / or delay is more appropriate in the advanced setting
- If during the preceding cycle, the patient has experienced neutrophils <0.5 x 10<sup>9</sup>/L or has febrile neutropenia diagnosed, GCSF should be considered
- If platelets persistently < 100 x 10<sup>9</sup>/L on Day 1 despite dose delay – see Consultant advice and consider dose reduction by 25%

### Non-haematological Toxicities

#### **Renal Impairment**

Consider dose reduction in severe renal impairment (GFR < 10ml/min) or serum creatinine > 3.0 – 6.0 x ULN. Discuss with the Consultant and consider dose reduction.

#### **Hepatic Impairment**

Bilirubin (µmol/L)	Epirubicin Dose
24 – 51	Give 50%
51 – 85	Give 25%
> 85	Omit

## Dose modifications for other toxicities as appropriate

Mucositis may appear 5-10 days after the start of treatment, and usually involves stomatitis with areas of painful erosions, mainly along the side of the tongue and the sublingual mucosa. For grade III Painful erythema or ulcers requiring IV rehydration resolving to Grade I or less painless ulcers or mild soreness: give Epirubicin 80% dose and recommend regular mouth care

Location of regimen delivery:                      Outpatient setting

Comments:    Maximum cumulative dose epirubicin = 950mg/m<sup>2</sup>  
 A baseline MUGA scan should be performed where the patient is considered at risk of having impaired cardiac function e.g. significant cardiac history, hypertension, obese, smoker, elderly, previous exposure to anthracyclines, previous thoracic radiotherapy. MUGA scan should be repeated if there is suspicion of cardiac toxicity at any point during treatment, or if cumulative anthracycline dose approaches maximum.

Drug interactions:                                      Use of Epirubicin with cardioactive compounds (e.g. calcium channel blockers) requires careful monitoring throughout treatment. Avoid commencing epirubicin based therapy for up to 25 weeks after stopping trastuzumab therapy  
 Cimetidine and Ciclosporin: can increase Epirubicin serum level  
 Verapamil: possibly increases Epirubicin bone marrow depressant effects  
 Cimetidine and Ciclosporin: can increase epirubicin serum levels  
 Clozapine: increased risk of agranulocytosis, avoid concomitant use  
 Digoxin tablets: reduced absorption (resolved by giving the liquid formulation of digoxin)  
 Phenytoin: reduced absorption of the antiepileptic  
 Verapamil: possibly increases epirubicin bone marrow depressant effects  
 Avoid live vaccines
